Re: *Ex Parte* Presentation in CC Docket Nos. 96-98, 99-68, and 01-92

Dear Ms. Dortch:

On September 22, 2004, Karen Brinkmann and I of Latham & Watkins met on behalf of CenturyTel, Inc. ("CenturyTel") with Matthew Brill, Senior Legal Advisor to Commissioner Abernathy, concerning the appropriate compensation mechanism for ISP-bound traffic. The attached enclosure summarizes the substance of our presentation.

In accordance with Commission rules, this letter and the attachments are being filed in the aforementioned dockets. If you have any questions, please contact me at (202) 637-1023.

Sincerely,

A handwritten signature in dark ink, appearing to read "Tonya Rutherford", with a large, sweeping flourish extending to the right.

Tonya Rutherford
Counsel for CenturyTel, Inc.

Enclosure

cc: Matt Brill

Compensation for ISP-Bound Traffic
(CC Dockets 96-98, 99-68, 01-92)

VNXX Arrangements Were Not Contemplated In the FCC ISP-Bound Traffic Order

- The FCC's 2001 *ISP Remand Order* noted that "an ISP's end-user customers typically access the Internet through an ISP server *located in the same local calling area.*"
- This observation is inconsistent with the use of virtual NXX arrangements, in which a telephone number associated with an exchange area is assigned to an ISP that is not physically located in that exchange area, and has no server in the local community.
- CenturyTel customers dial a "local" number according to the NPA-NXX code, but the traffic must be delivered to a distant ISP that does not have facilities in the local calling area in which the call originates, and in some instances not even in the same state.

VNXX Arrangements Impose Substantial Costs on CenturyTel

- If a dial-up Internet customer has an ISP whose server is not located in the originating LEC's local calling area, with a telephone number that accurately reflects the location of the server, the originating LEC would be properly compensated by charging access for the origination of that inter-exchange traffic. To avoid such charges, the ISP could simply establish a server in the originating LEC's local calling area.
- Under virtual NXX arrangements, CenturyTel must transport the traffic via the public switched network to a distant ISP server located outside of the LEC's local calling area. This ties up inter-office toll network facilities normally reserved for traffic that is subject to access charges, without the corresponding revenue.
- Due to the frequency of, and long holding times associated with dial-up Internet calls -- CenturyTel has customers logging 40,000 minutes per month on ISP-bound calls -- inter-office trunks can quickly become congested, raising the risk of toll traffic blockage; CenturyTel may have to add interoffice trunking facilities to alleviate this congestion.
- Normally when an interoffice trunk is added to accommodate increased toll traffic, the toll traffic generates sufficient access revenue to offset the cost of the trunk. In the case of virtual NXX traffic, however, unless access charges apply, there are no added revenues to offset the added costs.
- The cost associated with the need for additional interoffice trunks would be the direct result of the decision of the terminating LEC and its ISP customer to employ a virtual NXX arrangement, rather than locate a server in the local community.
- Such arrangements also give VNXX-based ISPs an unfair cost advantage over competing ISPs that *have* established servers in the local community.
- ILECs should not be denied the ability to recover their costs simply because another carrier assigns particular telephone numbers for the convenience of its ISP customers.

Compensation for ISP-Bound Traffic
(CC Dockets 96-98, 99-68, 01-92)

ISP-Bound Traffic That Is Inter-exchange In Nature Should Be Subject to Access Charges

- The FCC should conclude that dial-up ISP-bound traffic that does not originate and terminate in the calling party's local calling area is inter-exchange in nature and, like other inter-exchange traffic, is subject to access charges.

If the ISP's Premises Are Located Outside of the Calling Party's Local Calling Area, the FCC Should Conclude that ISP-Bound Traffic Is Inter-exchange in Nature

- Based on the FCC's traditional end-to-end analysis, the Commission should conclude that ISP-bound traffic is inter-exchange and subject to access charges if the ISP's premises are located outside of the calling party's local calling area. When a CenturyTel end-user dials an ISP, the ISP as an information service provider is the customer of the terminating LEC -- the call terminates when it is handed off to the ISP.
- The FCC must acknowledge that ISP end-user customers are accessing the Internet through ISP facilities that often are located outside of the end-user's local calling area, and that inter-carrier compensation arrangements should reflect that reality.

If the FCC Concludes that ISP-Bound Traffic that Originates and Terminates in Different Local Calling Areas Is Not Subject to Access Charges, the FCC Must Require the Terminating Carrier to Establish a Point of Interconnection Within the ILEC's Local Calling Area

- With the widespread use of virtual NXX arrangements, the ISP's premises no longer is "typically" located in the same local calling area as the dial-up customer. This is especially true in rural areas where some ISPs try to avoid installing a local server.
- Virtual NXX arrangements undermine the current ILEC rate structure by requiring ILECs to haul traffic beyond their local calling areas without compensation.
- Virtual NXX arrangements also raise the question whether ILECs are required to provide trunks to distant points of interconnection at their own expense. (The FCC sought comment on this issue in its pending intercarrier compensation proceeding; however, the FCC has not yet ruled on this point.)
- The FCC's rules must allow ILECs to recoup the cost of their networks.
- If the FCC rules that ISP-bound traffic is not subject to access charges, then the Commission should also rule that the terminating carrier serving the ISP must establish a direct point of interconnection within the originating ILEC's local calling area.
- Alternatively, a new compensation mechanism must be established so originating LECs will be able to recover the costs associated with carrying this traffic on their networks.
